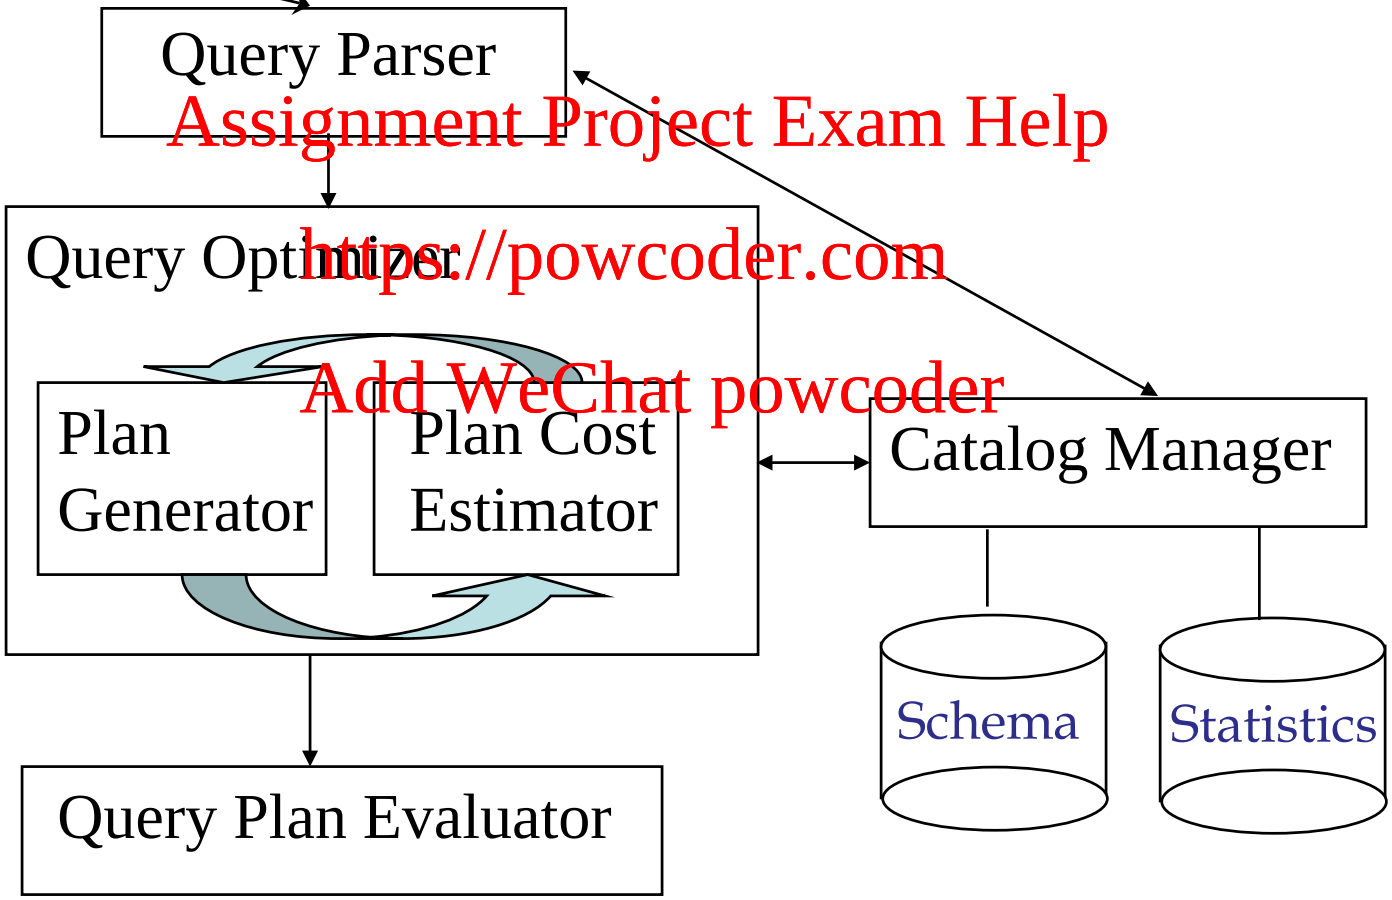
Readings: Chapter 12 and 15, Ramakrishnan & Gehrke, Database Systems

Query Processing Workflow: Review

Query

```
Select *
From Blah B
Where B.blah = "foo"
```



Assignment Project Exam Help
https://powcoder.com
Add WeChat powcoder

Query Optimization

- Typically there are many ways of executing a given query, all giving the same answer
- Cost of alternative methods often **varies enormously**
- Query optimization aims to find the execution strategy with the lowest cost

Assignment Project Exam Help
https://powcoder.com
Add WeChat powcoder

- We will cover:
  - Relational algebra equivalences
  - Cost estimation
    - Result size estimation and reduction factors
  - Enumeration of alternative plans

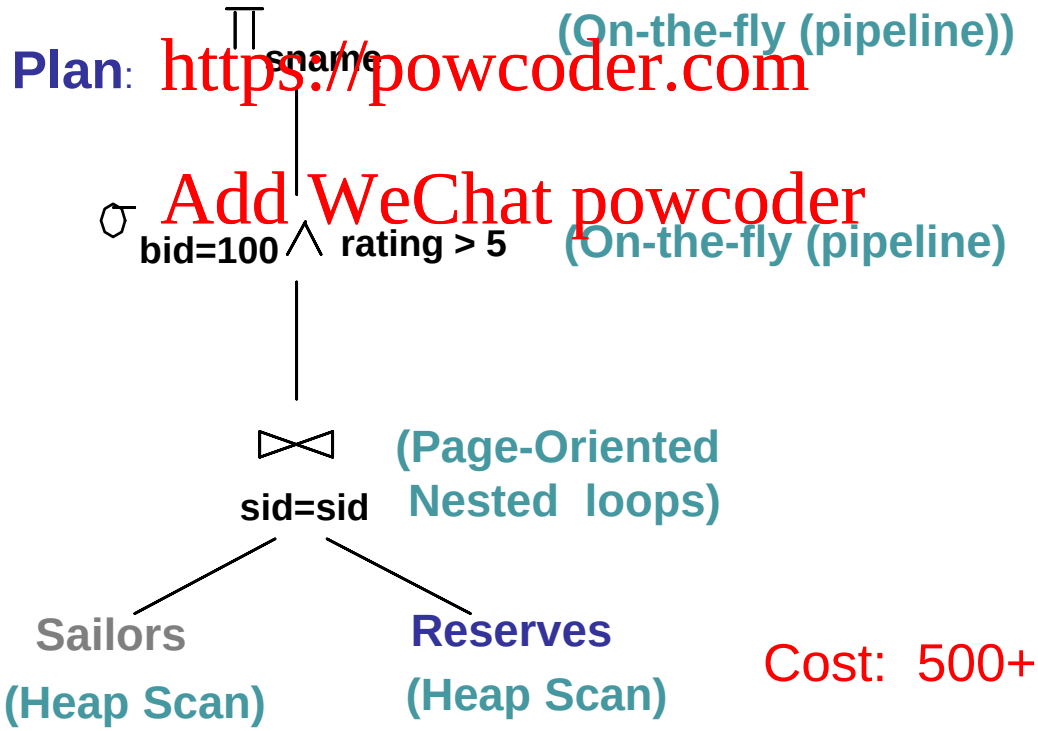
© University of Melbourne

Query Plan

- A tree, with relational algebra operators as nodes and access paths as leaves
- Each operator labeled with a choice of algorithm

SELECT sname from Sailors NATURAL JOIN Reserves
WHERE bid = 100 and rating > 5

Assignment Project Exam Help



Cost: 500+500*1000 I/O

Readings: Chapter 15, Ramakrishnan & Gehrke, Database Systems

A Familiar Schema for Examples

Sailors (*sid*: integer, *sname*: string, *rating*: integer, *age*: real)

Reserves (*sid*: integer, *bid*: integer, *day*: dates, *rname*: string)

Boats (*bid*: integer, *bname*: string, *color*: string)

Add WeChat powcoder

© University of Melbourne

Query Optimization Overview

Example:

```
SELECT  S.sname
  FROM  Reserves R, Sailors S
WHERE  R.sid=S.sid AND
   R.bid=100 AND S.rating>5
```

Assignment Project Exam Help

https://powcoder.com

Add WeChat powcoder

Query optimization steps:

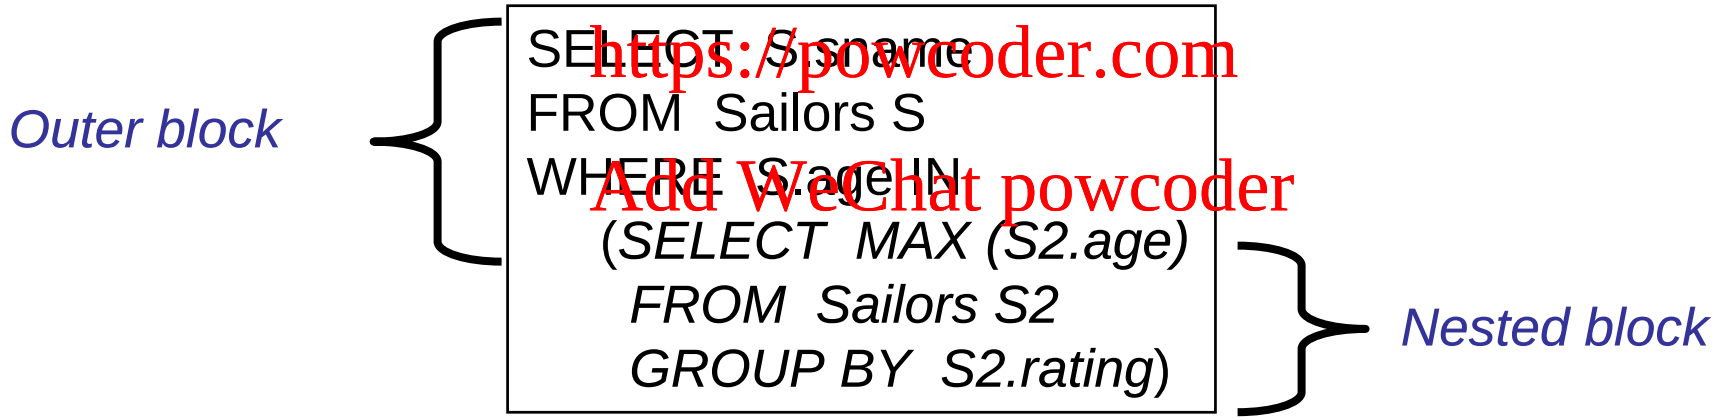
1. Query first broken into "blocks"
2. Each block converted to relational algebra
3. Then, for each block, several alternative query plans are considered
4. Plan with the lowest estimated cost is selected

© University of Melbourne

Step 1: Break query into query blocks

- Query block is any statement starting with select
- Query block = unit of optimization
- Typically inner most block is optimized first, then moving towards outers

Assignment Project Exam Help
https://powcoder.com
Add WeChat powcoder



© University of Melbourne

Step 2: Convert query block into relational algebra expression

Query:

```
SELECT  S.sid
FROM  Sailors S, Reserves R, Boats B
WHERE  S.sid = R.sid AND R.bid = B.bid AND B.color = “red”
```

Assignment Project Exam Help
https://powcoder.com
Add WeChat powcoder

Relational algebra:

$$\pi_{\text{S.sid}}(\sigma_{\text{B.color} = \text{“red”}}(\text{Sailors} \bowtie \text{Reserves} \bowtie \text{Boats}))$$

© University of Melbourne

Step 3: Relational Algebra Equivalences

- *Selections*: $\sigma_{c_1 \wedge \cdots \wedge c_n}(R) \equiv \sigma_{c_1}\left(\ldots\left(\sigma_{c_n}(R)\right)\right)$ *(Cascade)*

$\sigma_{c_1}\left(\sigma_{c_2}(R)\right) \equiv \sigma_{c_2}\left(\sigma_{c_1}(R)\right)$ *(Commute)*

Assignment Project Exam Help
https://powcoder.com
Add WeChat powcoder

- *Projections:* $\pi_{a_1}(R) \equiv \pi_{a_1}\left(\ldots\left(\pi_{a_n}(R)\right)\right)$ *(Cascade)*

a_i is a set of attributes of R and $a_i \subseteq a_{i+1}$ for $i = 1 \ldots n-1$

- These equivalences allow us to 'push' selections and projections ahead of joins.

© University of Melbourne

Examples

Selection:

$$\sigma_{age<18 \wedge rating>5}\ (Sailors)$$

$$\leftrightarrow \sigma_{age<18}\ (\sigma_{rating>5}\ (Sailors))$$

Assignment Project Exam Help

$$\leftrightarrow \sigma_{rating>5}\ (\sigma_{age<18}\ (Sailors))$$

https://powcoder.com

Projection:

Add WeChat powcoder

$$\pi_{age,rating}\ (Sailors) \leftrightarrow \pi_{age}\ (\pi_{rating}\ (Sailors))$$?

$$\pi_{age,rating}\ (Sailors) \leftrightarrow \pi_{age,rating}\ (\pi_{age,rating,sid}\ (Sailors))$$

© University of Melbourne

Another Equivalence

- A projection commutes with a selection that only uses attributes retained by the projection

Assignment Project Exam Help

$$\pi_{age,\ rating,\ sid}\ (\sigma_{age<18\ \wedge\ rating>5}\ (Sailors))$$

https://powcoder.com

$$\leftrightarrow\ \sigma_{age<18\ \wedge\ rating>5}\ (\pi_{age,\ rating,\ sid}\ (Sailors))$$

Add WeChat powcoder

$$\pi_{age,\ sid}\ (\sigma_{age<18\ \wedge\ rating>5}\ (Sailors))$$

?

$$\leftrightarrow\ \sigma_{age<18\ \wedge\ rating>5}\ (\pi_{age,\ sid}\ (Sailors))$$

© University of Melbourne

Equivalences Involving Joins

$$R \bowtie (S \bowtie T) \equiv (R \bowtie S) \bowtie T \quad \textit{(Associative)}$$

$$(R \bowtie S) \equiv (S \bowtie R) \quad \textit{(Commutative)}$$

Assignment Project Exam Help
https://powcoder.com
Add WeChat powcoder

- These equivalences allow us to choose **different join orders**

© University of Melbourne

Mixing Joins with Selections & Projections

- Converting selection + cross-product to join

$$\sigma_{S.sid = R.sid}(\text{Sailors} \times \text{Reserves})$$

$$\leftrightarrow \text{Sailors} \bowtie_{S.sid = R.sid} \text{Reserves}$$

Assignment Project Exam Help

- Selection on just attributes of S commutes with R ⋈ S

https://powcoder.com

$$\sigma_{S.age<18}(\text{Sailors} \bowtie_{S.sid = R.sid} \text{Reserves})$$

Add WeChat powcoder

$$\leftrightarrow (\sigma_{S.age<18}(\text{Sailors})) \bowtie_{S.sid = R.sid} \text{Reserves}$$

- We can also "push down" projection (*but be careful*…)

$$\pi_{S.sname}(\text{Sailors} \bowtie_{S.sid = R.sid} \text{Reserves})$$

$$\leftrightarrow \pi_{S.sname}(\pi_{sname,sid}(\text{Sailors}) \bowtie_{S.sid = R.sid} \pi_{sid}(\text{Reserves}))$$

© University of Melbourne

Cost Estimation

- For each plan considered, must estimate cost:
  - Must estimate *size of result* for each operation in tree
    - Use information about input relations (from the system catalogs), and apply rules (discussed next)
  - Must estimate *cost* of each operation in plan tree
    - Depends on input cardinalities
    - We've already discussed how to estimate the cost of operations (sequential scan, index scan, joins)
    - Next time we will calculate the cost of entire plans…

Assignment Project Exam Help
https://powcoder.com
Add WeChat powcoder

Statistics and Catalogs

- To decide on the cost, the optimizer needs information about the relations and indexes involved. This information is stored in the system **catalogs**.

- **Catalogs** typically contain at least:
  - # tuples (**NTuples**) and # pages (**NPages**) per relation
  - # distinct key values (**NKeys**) for each index (or relation attribute)
  - low/high key values (**Low/High**) for each index (or relation attribute)
  - Index height (**Height(I)**) for each tree index
  - # index pages (**NPages(I)**) for each index

Assignment Project Exam Help
https://powcoder.com
Add WeChat powcoder

- Statistics in catalogs are updated periodically

Result size estimation

- Consider a query block:

```
SELECT  attribute list
  FROM  relation list
WHERE  predicate1 AND ... AND predicate_k
```

Assignment Project Exam Help

- Maximum number of tuples in the result is the product of the cardinalities of relations in the FROM clause

https://powcoder.com

Add WeChat powcoder

- Reduction factor (RF) associated with each predicate reflects the impact of the predicate in reducing the result size. RF is also called selectivity.

© University of Melbourne

Result size estimation calculations

- Single table selection:

$$\textbf{ResultSize} = \mathbf{N}\boldsymbol{Tuples}(\boldsymbol{R}) \prod_{i=1..n} \boldsymbol{RF_i}$$

Assignment Project Exam Help

- Joins (over k tables):

https://powcoder.com

$$\textbf{ResultSize} = \prod_{j=1..k} \boldsymbol{NTuples}(\boldsymbol{R_j}) \prod_{i=1..n} \boldsymbol{RF_i}$$

Add WeChat powcoder

- If there are no selections (no predicates), reduction factors are simply ignored, i.e. they are ==1

© University of Melbourne

Calculating Reduction Factors(RF)

- Depend on the type of the predicate:

1. Col = value
   RF = 1/NKeys(Col)

2. Col > value
   RF = (High(Col) – value) / (High(Col) – Low(Col))

3. Col < value
   RF = (val – Low(Col)) / (High(Col) – Low(Col))

4. Col_A = Col_B (for joins)
   RF = 1/ (Max (NKeys(Col_A), NKeys(Col_B)))

5. In no information about Nkeys or interval, use a “magic number” 1/10
   RF = 1/10

Assignment Project Exam Help
https://powcoder.com
Add WeChat powcoder

Let's try it..

Sailors (S): NTuples(S) =1000, Nkeys(rating) = 10 interval [1-10], age interval [0-100], Nkeys(sid)=1000

*SELECT * FROM Sailors WHERE rating = 3 AND age > 50;*

Assignment Project Exam Help

Calculate result size:

https://powcoder.com

NTuples(S) = 1000

RF(rating) = 1/10 = 0.1

Add WeChat powcoder

RF(age) = (100-50)/(100-0) = 0.5

ResultSize = NTuples(S)*RF(rating)*RF(age)

= 1000*0.1*0.5= 50 tuples

© University of Melbourne

What's examinable

- What is query optimization/describe steps?
- Equivalence classes
- Result size estimation

Assignment Project Exam Help

- Important for Assignment 3 as well
